

11. Worker Influx

Total \$ Redistributed	Base	Proposed
Worker Influx	\$1 261 464	\$1 364 936

This factor is designed to reflect the additional costs imposed on municipalities that have significant daily net influxes of non-resident workers. Worker Influx CA currently applies to three expenditure categories:

- planning and community amenities;
- waste management and environment; and
- recreation and culture.

This CA is calculated from place of work data as provided by the latest census. This CA has been updated with 2006 Census data that will be used to calculate the 2009-10 distribution.

The census provides data on the numbers of persons who exit a municipality for work, and the numbers of persons entering the municipality for work. This data gives the inflow and outflow of persons for each municipality. Total outflows of workers are scaled to equal the total inflows as these two totals do not automatically equate in the census data. The scaled outflows are then taken from the inflows to calculate a 'net inflow', at which point the 'net inflow' can be calculated into relativities based on the state average.

Updated CA Data

This CA is based on census data. As 2006 Census data is available, this CA will be updated to apply to and from the 2009-10 distribution. Appendices 4 & 5 show the 2001 and 2006 Census data respectively. As the census is collected every five years, the data is subject to variability as there may be significant change over the intervening period.

The table below shows the net inflows for each council for the 2001 and 2006 Census. There have been some significant percentage shifts for some councils. However, the majority have been shifts from a low base, thus exaggerating the percentage change.

As a whole, Tasmania has experienced an increase in the number of workers travelling to other municipalities for work. The scaled 'net inflows' have increased from the 2001 Census results by 4 561, which is 9.8 per cent. However, this does not mean that an additional 4 561 workers are travelling between municipalities each day, as the actual outflows have been adjusted to match the inflows. However, for the purposes of this CA the increase in the scaled redistribution is important as this will result in a greater redistribution of grants by this CA.

	Scaled Net Inflow		Change	
	2001 Census	2006 Census		%

Impact of Updated CA

The total funds redistributed by this CA based on 2006-07 data after updating to use 2006 Census data is \$1 364 936, and the councils that can claim an increase in their 'net inflow' will be the beneficiaries of the application of the new census data. As can be seen from the table above Burnie, Devonport, Hobart and Meander Valley show the greatest increases in 'net inflow' when comparing Census data.

However, as can be seen in Appendix 3, the councils that gain from this CA are the regional centres of Burnie, Devonport, Hobart and Launceston, as they are the only councils with a cost adjustor greater than 1.00.
